(57) Abstract

This invention provides an isolated receptor having the amino acid sequence of Fig. 1 or substantially the same amino acid sequence as the amino acid sequence shown in Fig. 1 or an amino acid sequence functionally similar to that sequence, and DNA sequences encoding such a receptor.

OR-1 ON ORPHAN RECEPTOR BELONGING TO THE NUCLEAR RECEPTOR FAMILY

This invention relates to cellular nuclear receptors.

- 5 A large family of nuclear receptors has been identified which confer cells with responsiveness to molecules such as retinoic acid, vitamin D3, steroid hormones and thyroid hormones. Extensive studies have shown that the members of this superfamily of nuclear receptors activate and/or repress gene transcription through direct binding to discrete *cis*- acting elements termed "hormone response elements" (HRE). It has been
- 10 shown that these HRE's comprise repeats of consensus palindromic hexanucleotide DNA motifs. The specificity of the HRE's is determined by the orientation of, and spacing between, halfsites (i.e. half a palindromic sequence)(Umenesono K., *et al*, 1991 *Cell* 65, 1255-1266).
- 15 Specific DNA binding is mediated by a distinct DNA binding domain, containing two zinc fingers, which is conserved among all thus discovered nuclear receptors. Three amino acids at the C-terminal base of the first zinc finger (known as the "P-box") are important for the recognition of the half site nucleotide sequence. Members of the nuclear receptor superfamily have been classified into different groups on the basis of the amino acid
- 20 sequence within the P box.

0 Molecules thought to be nuclear receptors, as they are structurally related to characterized receptors, but for which no ligand has been identified are termed "orphan receptors". Many such orphan receptors have been identified (see for example Evans R.M, (1988) *Science* 240,889-895 and O'Malley, B. (1990) *Mol. Endocrinol.* 4 363-369).

5 According to one aspect of the invention there is provided a novel nuclear receptor, hereinafter termed "OR-1", having the amino acid sequence of Figure 1 or substantially the same amino acid sequence as the amino acid sequence shown in Fig. 1 or an amino acid sequence functionally similar to that sequence.

10 An amino acid sequence which is more than about 90%, preferably more than 95%, identical with the sequence shown in Fig. 1 is substantially the same amino acid sequence for the purposes of the present application.

According to another aspect of the invention there is provided a DNA sequence encoding a
15 nuclear receptor according to the first aspect of the invention. Preferably, the DNA sequence is that given in Fig. 2 or is a DNA sequence encoding a protein or polypeptide having the functionality of OR-1.

The nuclear receptor of the invention has a similar P-box configuration to the retinoic acid
20 receptor (RAR), the vitamin D receptor (VDR), and the thyroid hormone receptor (TR) and can be placed in the same subfamily as those receptors.

0 Preferably, the receptor heterodimerizes with RXR to form a complex.

Preferably, the receptor interacts with RXR and binds to a DNA sequence comprising at least one repeat of the DNA sequence -AGGTCA-. Preferably the sequence is AGTCAGGTCACCTCGAGGTCAGTCA.

5

Preferably, the receptor modulates 9-*cis* retinoic acid signalling.

The nuclear receptor of the invention, OR-1, and its method of production will now be described, by way of example only, with reference to the accompanying drawings Figures

10 1 -5, in which :

Fig. 1 shows the amino acid sequence of a nuclear receptor of the invention;

Fig. 2 shows the DNA sequence of a nuclear receptor of the invention;

15

Fig. 3 gives a comparison between the primary amino acid sequences of the nuclear receptor of the invention and those of other members of the nuclear receptor superfamily;

Fig. 4 Localization of OR-1 mRNA - producing cells in rat tissues with in situ

20 hybridization;

Fig. 5A gives the DNA sequences of seven potential HRE's DR-0 - DR-6;

0 Fig. 5B illustrates the interaction between OR-1 or the retinoid X receptor (RXR) and the potential HRE's, DR-2 and DR4; and

Fig. 6 illustrates experiments showing that OR-1 confers 9-*cis* retinoic acid-responsiveness of RXR on a DR-4 -containing promoter.

5

CLONING AND EXPRESSION OF OR-1

Rat OR-1 was cloned from a cDNA library from Sprague Dawley rat liver in the commercially-available λ ZAP vector (Stratagene, USA) using the techniques described in Götlicher, M. *et al* (1992) *Proc. Natl. Acad. Sci. USA* 89, 4653-4657.

10 Foetal and adult rat tissues were excised after decapitation and frozen on dry ice. Cryostat sections were hybridized to 48-mer oligonucleotides complementary to OR-1 mRNA positions 100-151 and 850-900 as described in Dagerlind, Å *et al* (1992) *Histochemistry* 98 34-49.

Several unrelated oligonucleotides were also used as controls. The addition of 100 fold of
15 the respective nonlabelled control oligonucleotide abolished all labelling observed with the OR-1 probes.

PLASMIDS

OR-1 cDNA was subcloned as an Eco RI fragment in pGEM-3Z (Promega) to produce the
20 plasmid pROR-1-Sp6, or in the multiple cloning site of pCMV5 (described in Andersson, S. *et al* 1989 *J. Biol. Chem.*, 264, 8222-8229) to produce the plasmid pCMV-OR-1. The reporter construct pDR4-AF contains a SphI-XhoI fragment of the cDNA for a secreted

- 0 form of human PAP (placental alkaline phosphatase) described in (Berger, J. *et al.* 1988 *Gene* 66,1-10) under the control of a DR4-TK-containing promoter, pRRXR-T7 and pCMV-RXR described previously in Gearing, K.L. *et al* 1993 *Proc. Natl. Acad. Sci. USA* 90, 1440-1444.

5 DNA BINDING STUDIES

- Gel shifts were performed using *in vitro*-translated OR-1 and RXR with the commercially-available TNT™-coupled reticulocyte lysate system (Promega, Madison USA). Proteins were incubated on ice for 15 min with 4μg of poly (dI-dC) and with unlabelled competitor DNA where indicated in a solution comprising 100mM KCl; 10mM Hepes, pH7.6; 1mM dithiothreitol; 1 mM EDTA; 10% (wt./vol) glycerol, before addition of 0.5 ng of a ³²P-end
10 labelled oligonucleotide probe. The reaction mixtures were incubated for a further 10 min at 22° C before electrophoresis at 200V and 4 °C in pre-run 4 % polyacrylamide/ 0.25 TBE (0.089m tris-borate pH 8.3, 0.025 EDTA) gels.

- 15 The following oligonucleotides and their complements were used as probes:

DR0 AGCTTCAGGTCAAGGTCAGGTTCA

DR1 AGCTTCAGGTCACAGGTCAGTTCA

DR2 AGCTTAGGTCACCAGGTCAGTTCA

DR3 AGTCCAGGTCAGTCAAGGTCAGTCA

20 DR4 AGTCAGGTCAGTCAAGGTCAGTCA

DR5 AGTCAGGTCAGTCAAGGTCAGTCA

DR6 AGTCAGGTCAGTCAAGGTCAGTCA

0 CELLS AND TRANSFECTION

Embryonal carcinoma P19 EC cells were cultured in Dulbecco's modified Eagle's medium supplemented with 10% foetal calf serum, nonessential amino acids, penicillin (100 units/ml) and streptomycin (100mg/ml). Chinese Hamster Ovary (CHO) cells were cultured in Ham's F-12 medium supplemented with 10% foetal calf serum, penicillin (100 units/ml) and streptomycin (100 mg/ml). Cells were plated in duplicate in 35mm Petri dishes and transfected at 30% confluency, using lipofectin reagent (Bethesda Research Laboratories, USA) according to the recommendations of the supplier. After 12 hours the medium was changed and supplemented or not supplemented as the case may be with 100nM 9-*cis* retinoic acid (a gift of Hoffman-LaRoche) as indicated, and incubated for an additional 36h. Cell culture supernatants were then heated to 65°C for 30min. PAP activity was determined as the increase in A_{405} at 30°C in a 1 ml reaction mixture containing 0.75ml of supernatant, 200nM Tris (pH8.8.), 275 mM NaCl, 0.5 mM $MgCl_2$, and 5mM p-nitrophenylphosphate.

Transfections were repeated 6 times with different plasmid preparations and data from a representative experiment is presented here.

RESULTS

The OR-1 clone spans 1940bp including a 55bp long poly-A tail and contains an open reading frame starting with an ATG corresponding to a protein of 446 amino acids with a predicted molecular weight of 50kD. The complete amino acid and nucleotide sequences of OR-1 are given in Fig. 1 and 2 respectively. OR-1 shows no striking homology to known members of the nuclear receptors superfamily: the highest homologies represent less than

0 10% in the N-terminal domain, about 50% in the DNA binding domain, and between 20-30 % in the putative ligand binding domain as shown in Fig.3.

The amino-terminal domain of OR-1 (underlined in Fig. 1) is 77 amino acids long and to a large extent comprises a so-called "PEST" sequence, meaning that it is an amino acid sequence rich in proline, glutamic acid, serine, threonine, and aspartic acid residues.

5 The DNA binding domain consists of 68 amino acids including the nine invariable cysteines characteristic of the members of the nuclear receptor superfamily, as well as other amino acids that are found to be conserved in all members of this protein family.

GENOMIC CLONING

10 A rat genomic fragment has been isolated, that spans the DNA binding domain or OR1 and all the exons downstream of it. Most nuclear receptors for which the genomic structure has been determined have the two zinc "fingers" of the DNA binding domain encoded on separate exons. We have shown that the whole DNA-binding domain is encoded by one exon in OR1. We have furthermore shown that this is also the case with RLD-1 (*Mol.*
15 *Endocrinol. infra*), a closely related receptor "knock-out" mice of OR1 and RLD-1.

TISSUE DISTRIBUTION OF OR-1

To analyse the tissue distribution of OR-1 transcripts, *in situ* hybridizations were performed on foetal and adult rat tissues. Labelling for OR-1 was found in several tissues
20 of both foetal and adult rats. As discussed, below, prominent expression was observed in liver, lung, thymus, brown fat, salivary gland, thyroid gland, pituitary gland and retina whereas moderate levels were seen in developing cerebrum and cerebellum, in

0 perichondrium around developing bones, heart and skin. Low levels of OR-1 mRNA was
present in skeletal muscle as shown in Fig. 4. In adult rats, strong labelling was found in
lymph node, prostate, adrenal cortex and the intermediate lobe of the pituitary gland.
Moderate levels were seen in liver, testis, salivary gland, thyroid and parathyroid gland,
adrenal medulla, anterior pituitary and kidney. In the brain, a moderate signal was
5 observed in neurons in the granular cell layer of the cerebellum and hippocampus.

1) IMMUNE SYSTEM

Prominent expression of OR-1 mRNA was seen in the cortex of the thymus with
lower levels in the medulla. In dipped sections grains were seen over most of the
10 thymocytes in the cortex. Significant expression was also seen in the lymph nodes,
whereas low levels were observed in spleen. Some cells in the bone marrow
expressed OR-1 mRNA.

2) ENDOCRINE SYSTEM

15 Significant expression of OR-1 was seen in the anterior and intermediate lobes of
the pituitary. In dipped sections grains could be seen over most of the cells in the
intermediate lobe and over the majority of the cells in the anterior lobe. The
posterior lobe appeared virtually nonlabelled. Prominent expression of OR-1 was
detected in the parathyroid glands where most of the cells expressed OR-1 mRNA.
20 In the thyroid gland moderate expression was observed and OR-1 mRNA was
heterogenously distributed in different cell types. Most of the parafollicular cells
expressed OR-1, whereas only part of the follicular cells were labelled.

0 High expression in the adrenal gland was observed in all layers of the
cortex, whereas lower levels were seen in the medulla. Expression of OR-1
was slightly higher in the zona glomerulosa than in the rest of the cortex. In
the adrenal medulla the labelling was heterogenous and part of the
chromaffin cells and ganglion cells expressed OR-1. In pineal gland some
5 cells contained OR-1 mRNA.

3) REPRODUCTIVE SYSTEM

OR-1 could be detected both in male and remale genital organs. In the testis
OR-1 mRNA was present in all cross-sections of the seminiferous tubules.

10 The labelling localizes to the basal compartment of the seminiferous
epithelium and grains could be seen mainly over primary spermatocytes,
whereas spermatogonia and germ cells at later developmental stages were
non-labelled. The Sertoli cells and Leydig cells did not express OR-1
mRNA. A strong signal for OR-1 was evident in the epithelium of the
15 prostate gland and also in the epididymis, whereas low levels were seen in
the epithelium of the vesicula seminalis. In the ovary oocytes at different
stages of development expressed OR-1 mRNA while other cells appeared
non-labelled. In the uterus the epithelium was strongly labelled and lower
leves of OR-1 mRNA were seen in the myometrium.

4) URINARY SYSTEM

Moderate expression of OR-1 could be detected in the outer medulla of the

0 kidney, whereas in the cortex and inner medulla the labelling was very low
or nondetectable. In dipped sections grains were seen over different parts of
the loop of Henle. The glomeruli, proximal and distal convoluted tubules
and collecting tubules did not express OR-1 at detectable levels. The
transitional epithelium of the renal pelvis expressed OR-1.

5

5) DIGESTIVE SYSTEM

In salivary glands the secretory acini and the ducts expressed moderate
levels of OR-1 mRNA. In the liver OR-1 mRNA was evenly distributed
throughout the liver and most, if not all, hepatocytes were labelled. In the
10 intestinal tract OR-1 was expressed in the epithelium of stomach and small
and large intestine.

6) NERVOUS SYSTEM

Significant expression of OR-1 was seen in the sympathetic and sensory
15 ganglia. In superior cervical ganglion most of the sympathetic neurons
expressed OR-1 at high level and also the satellite cells were labelled. In
dorsal root ganglion the labelling was heterogenous and varied between
individual neurons. The Schwann cells of peripheral nerves expressed OR-1
whereas oligodendrocytes in optic nerve were nonlabelled. In the retina the
20 bipolar cells expressed OR-1. In the central nervous system OR-1 mRNA
was seen in several areas including hippocampus and cerebellum.

0 7) **RESPIRATORY SYSTEM**

Moderate expression of OR-1 was seen in the bronchial epithelium and in the alveoli.

8) **OTHER TISSUES**

5 Low or non-detectable levels of OR-1 were seen in skeletal muscle and heart. Also in white adipose tissue OR-1 expression was below the detection limit. In skin a clear signal was observed in keratinocytes in the basal part of the epidermis. A strong signal was seen in perichondrium around the cartilage in trachea. Low expression of OR-1 could be seen in intra and extraorbital
10 lacrimal glands.

The expression of OR-1 thus appears to be ubiquitous, suggesting that this receptor might have a house keeping function and/or mediate many effects by regulating the transcription of various genes. The tissue distribution of
15 OR-1 is different from the tissue distribution of RLD-1 (*Mol Endocrinol* 9, 72-85, 1995) suggesting that these two isoforms might have different functions. OR-1 is particularly well expressed in tissues involved in the immune system. It has been described that 9-cis retinoic acid plays a role in thymocyte development, being a potent negative regulator of activation-
20 induced T-cell apoptosis. Since OR-1 dimerizes with RXR and is expressed at a high level in the thymus during the fetal stages, it may play a role in regulating T-cells development. OR-1 is also well expressed in peripheral

0 endocrine glands, in male and female genital organs and in the nervous
system. The tissue distribution of OR-1 is thus different from that of RXR α
which has been described to be noticeably abundant in visceral tissues such
as liver, kidney, lung, brain, heart, intestine and testis. We previously
suggested that OR-1 could act as a helper of RXR α in mediating the effects
5 of 9-cis retinoic acid. Nevertheless we do not know whether OR-1 could
also act as a monomer, as a homodimer or as a heterodimer with another
protein than RXR α . For example, it is possible that OR-1 modulates the
actions of RXR β that shows a diffuse and probably ubiquitous expression,
and of RXR γ which has a more specific distribution.

10

OR-1 INTERACTS WITH RXR ON A DR4 MOTIF *IN VITRO*

A set of potential HRE's, DR0-DR6, having the DNA sequences described above predicted
by the 3-4-5 rule (Umenson *et al supra*) was synthesized and assayed in gel shift
experiments using *in vitro* translated OR-1 alone or in combination with RXR also
15 translated *in vitro*. *In vitro* translation of OR-1 produced a protein of the predicted size of
50kD. In the gel shift assays, OR-1 was unable to bind to any of the potential HRE's but
OR-1 combined with RXR, recognized the potential HRE DR4 which is usually described
as the thyroid hormone response element (TRE)(Umenson *et al supra*).

20 Fig. 5B shows that although OR-1 or RXR alone was not able to bind to DR4, together
these proteins were able to form a specific complex with this DNA element. The
appearance of this complex depends on the presence of RXR and is inhibited by a 10-fold

0 excess of the specific DNA target element, but not by a 100-fold excess of an unrelated DNA element - see Fig. 5B, lane 7)

OR-1 CONFERS 9-CIS RETINOIC ACID RESPONSIVENESS OF RXR ON A DR4-CONTAINING PROMOTER

5 Since OR-1 and RXR formed a specific complex on the DR4 sequence *in vitro*, coexpression of OR-1 in embryonal carcinoma (EC) cells that express endogenous RXR was tested to determine whether it could affect the activity of a reporter gene under the control of a DR4-containing promoter. RXR has been shown to be an auxiliary receptor for several classes of hormone receptors, controlling the ligand responses of receptors that
10 form heterodimers with RXR (Yu, V.C. *et al* 1991 *Cell* 67, 251-1266 and Bugge, T.H. *et al* 1992 *EMBO J.* 11, 1409-1418). In addition, it has been shown that 9-*cis* retinoic acid leads to effective RXR homodimer formation and that these homodimers bind and activate several retinoic acid response elements ("RARE's"), but not natural thyroid hormone response elements (Zhang, X.K. *et al* 1992 *Nature (London)* 358, 587-591). As previously
15 described by others (Hallenbeck, P.L. *et al* 1993, *J. Biol Chem.* 268, 3825-3828) our transfection studies showed no induction by 9-*cis* retinoic acid of RXR on a reporter containing DR4 (Fig 5). Expression of OR-1 allowed activation of RXR by 9-*cis* retinoic acid on a DR4-containing promoter. In CHO cells that do not express endogenous RXR at as high a level as EC cells, cotransfection of RXR together with OR-1 is necessary to
20 obtain induction by 9-*cis* retinoic acid. Thus acting as a helper of RXR, OR-1 appears to confer 9-*cis* retinoic acid signalling on DR4-containing promoters.

CLAIMS

1. An isolated nuclear receptor, having the amino acid sequence of Fig. 1 or substantially the same amino acid sequence as the amino acid sequence shown in Fig. 1 or an amino acid sequence functionally similar to that sequence.

2. A receptor according to claim 1 which is derived from rat.

3. A receptor according to claim 1 or 2 which binds to a DNA sequence comprising at least one repeat of the DNA sequence -AGGTCA-

4. A receptor according to claim 3 in which the DNA sequence comprises AGTCAGGTCACCTCGAGGTCAGTCA.

5. A receptor according to any one of claims 1 to 4 which heterodimerizes with RXR to form a complex.

6. A complex comprising a receptor according to any preceding claim and RXR.

7. An amino acid sequence encoding a receptor according to claim 1 which is at least 90% identical with the amino acid sequence of Fig. 1.

8. An amino acid sequence according to claim 7 which is at least 95% identical

0 with the amino acid sequence of Fig. 1.

9. A DNA sequence encoding a nuclear receptor according to any one of claims 1 to 5 or a functionally similar nuclear receptor.

5 10. A DNA sequence according to claim 9 in which the DNA sequence is that given in Fig.2 or a DNA sequence substantially similar to that sequence.

11. The use of a nuclear receptor according to any one of claims 1 to 5 or a complex according to claim 6 or a ligand therefor in medicine.

10

12. The use of a nuclear receptor according to any one of claims 1 to 5 to modulate retinoic acid signalling *in vivo* or *in vitro*.

(57) Abstract

This invention provides an isolated receptor having the amino acid sequence of Fig. 1 or substantially the same amino acid sequence as the amino acid sequence shown in Fig. 1 or an amino acid sequence functionally similar to that sequence, and DNA sequences encoding such a receptor.

INTERNATIONAL SEARCH REPORT

International Application No.
PCT/EP 95/03247

A. CLASSIFICATION OF SUBJECT MATTER
IPC 6 C12N15/12 C07K14/705

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)
IPC 6 C12N C07K

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
P,X	SONG, CHING 'Characterization of a ubiquitous receptor, a new member of the nuclear receptor superfamily', UNIV. CHICAGO;CHICAGO;IL;USA, 1994, 160 PP. & Diss Abstract. Int. B, 1994; 55(3), 734-734 see the whole document ---	1-12
P,X	WO,A,95 13373 (ARCH DEV CORP ;LIAO SHUTSUNG (US); SONG CHING (US)) 18 May 1995 see the whole document --- -/--	1-12

☒ Further documents are listed in the continuation of box C.

☒ Patent family members are listed in annex.

* Special categories of cited documents:

- "A" document defining the general state of the art which is not considered to be of particular relevance
- "E" earlier document but published on or after the international filing date
- "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- "O" document referring to an oral disclosure, use, exhibition or other means
- "P" document published prior to the international filing date but later than the priority date claimed

- "T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- "X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- "Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
- "&" document member of the same patent family

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
P,X	PROC NATL ACAD SCI U S A, MAR 14 1995, 92 (6) P2096-100, UNITED STATES, TEBOUL M ET AL 'OR-1, a member of the nuclear receptor superfamily that interacts with the 9-cis-retinoic acid receptor.' see the whole document -----	1-12

INTERNATIONAL SEARCH REPORT

International application No.

PCT/EP 95/ 03247

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 11, 12
because they relate to subject matter not required to be searched by this Authority, namely:
Remark: Although claims 11, 12 are directed to a method of treatment of the human/animal body as well as diagnostic methods, (Rule 39.1(IV)PCT; as far as used in vivo, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
